

Travel Together _Concept _I

The following work was produced during summer 2015 internship at Tata Elxsi.

My project was on Connected Car Infotainment Systems. This was divided into three stages:

- i) To research and compile a report on current features of Connected Car Infotainment systems of various automobile companies
- ii) Survey about the features desired by the public in Connected Car Infotainment systems
- iii) To come up with a new In-Car application and make wireframes for the same

After successfully completing the first two stages, I proposed the concept of 'Travel Together', a navigation feature that helps to plan and implement group travel and helps to keep track of other friends/family on the road.

As an individual project, I conceptualized the Travel Together app idea, the flow of information in the wireframes, and the design and layout of each wireframe. The automobile company's (client's) logo and wireframe dimensions were provided to me. I was constantly reporting my work to my supervisor and getting feedback while designing wireframes. This work was presented to Tata Elxsi's automobile client's team.

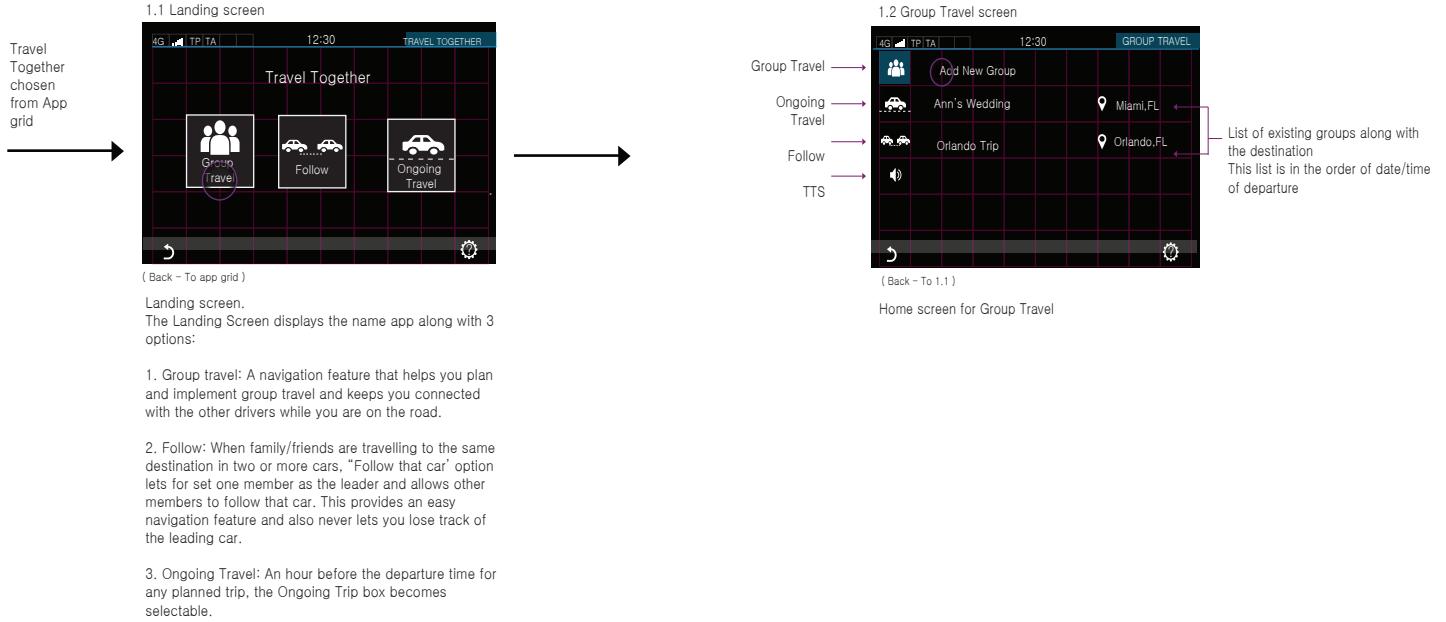

For submission of this work, Tata Elxsi's automobile client's name and logo have been removed from the wireframes.
